

3 February 2021

Continued strong drilling results from Tujuh Bukit Copper Project

PT Merdeka Copper Gold Tbk (IDX: MDKA, “Merdeka”, “Company”) is pleased to provide this update covering the most recent drilling from the Tujuh Bukit Copper Project (“TB Copper”, “the Project”) (MDKA 100%) located on the eastern end of the island of Java, Indonesia. All five recent drill holes returned significant intercepts of copper and gold mineralisation.

The focus of the current drilling program is an area of the Upper High Grade Zone (“UHGZ”) which contains the largest zone of contiguous high grade copper and gold mineralisation identified to date and is well positioned for drilling from the current decline location.

- ✦ The most recent five holes of the current infill drilling program have all returned intercepts in line with, or exceeding expectations.
- ✦ Selected results from the latest drilling include¹:
 - 242 metres @ 0.7% Cu and 1.0 grams/tonne Au from 346 metres in UHGZ-20-029 (including 192 metres @ 0.8% Cu and 1.2 grams/tonne Au from 354 metres)
 - 184 metres @ 0.9% Cu and 1.0 grams/tonne Au from 228 metres in UHGZ-20-030 (including 146m @ 1.0% Cu and 1.1 grams/tonne Au from 264m)
 - 124 metres @ 0.8% Cu and 0.7 grams/tonne Au from 304 metres in UHGZ-20-028 (including 98 metres @ 0.9% Cu and 0.8 grams/tonne Au from 310 metres)
 - 250 metres @ 0.5% Cu and 0.5 grams/tonne Au from 466 metres in UHGZ-20-025 (including 88 metres @ 0.8% Cu and 0.7 grams/tonne Au from 558 metres)
 - 186 metres @ 0.7% Cu and 0.7 grams/tonne Au from 206 metres in UHGZ-20-027 (including 120 metres @ 0.9% Cu and 0.9 grams/tonne Au from 244 metres)

The full copper and gold intercepts discussed in this report are listed in Table 2.

Merdeka Vice President Director, Simon Milroy, commented:

“The ongoing results from the drilling at the Tujuh Bukit Copper Project continue to confirm or exceed expectations. It is pleasing to see the ongoing improvements in drilling productivity following the change to the larger drill rigs.”

¹ Results reported using a 0.2% Cu cut-off, and a minimum intercept length of 30 metres.

UPPER HIGH GRADE ZONE

The UHGZ exploration target has been defined within the top 500 metres of the Tujuh Bukit Copper Project Mineral Resource and contains an Exploration Target ranging from 250-300 Mt @ 0.7-0.9 % Cu & 0.7-0.9 grams/tonne Au.

Project schedules have been adjusted to prioritise drilling an area of the UHGZ containing the largest zone of contiguous high grade copper and gold mineralisation identified to date, accelerating data collection for permitting, resource estimation and subsequent mining and other studies. Drilling and study work for the remainder of the UHGZ will be completed following the current program.

Figure 1: Location map of Tujuh Bukit Copper Project showing reported drill hole collars and sections, 2012 Resource 0.2% copper outline, 0.5% copper contour and surface features.

DRILLING RESULTS

Drilling is conducted from a limited number of underground drilling locations, and therefore drilling is not on regularly spaced sections. For ease of reference, the drill holes reported have been grouped into three “drilling sections” (sections A to C) as shown in Figure 1. On each section, the significant intercepts given in the table have a reference for locating them on the drilling section figure.

Resource definition holes UHGZ-20-025 and UHGZ-20-027 were drilled into areas where there were gaps in the current information to determine if the mineralisation extended into this area. Drill holes UHGZ-20-028 and UHGZ-20-030 were drilled on the north-western edge of the target zone to test for an extension of the mineralisation along strike. Drillhole UHGZ-20-029 was drilled to test a gap in the interpreted higher grade zone.

Drilling Section A – Drill holes UHGZ-20-025 and UHGZ-20-027

Drilling on this section followed on from the encouraging results reported previously on adjacent sections to extend the mineralised zone in a 250m gap between previous drill holes, and to test its upper extent. Both holes have extended the known mineralised envelope, and successfully intercepted the barren hanging wall.

Drill hole UHGZ-20-025 intercepted mineralisation at 466 m down hole, reporting an intercept of 250 m @ 0.5 % Cu and 0.5 g/t Au, with a total drill depth of 776.2 m, before exiting the mineralised zone at depth. Within the broader mineralised zone, a higher grade intercept of 88m @ 0.8 % Cu and 0.7 g/t Au, extended the previously interpreted high grade zone on the section.

Drill hole UHGZ-20-027 was drilled into an area above the previously interpreted mineralisation to test the upper extents of the mineralised zone. UHGZ-20-027 intercepted 186m @ 0.7% Cu and 0.7 g/t Au, including an intercept of 120m @ 0.9 % Cu and 0.9 g/t Au which will extend the higher grade mineralised zone upwards from previous interpretations.

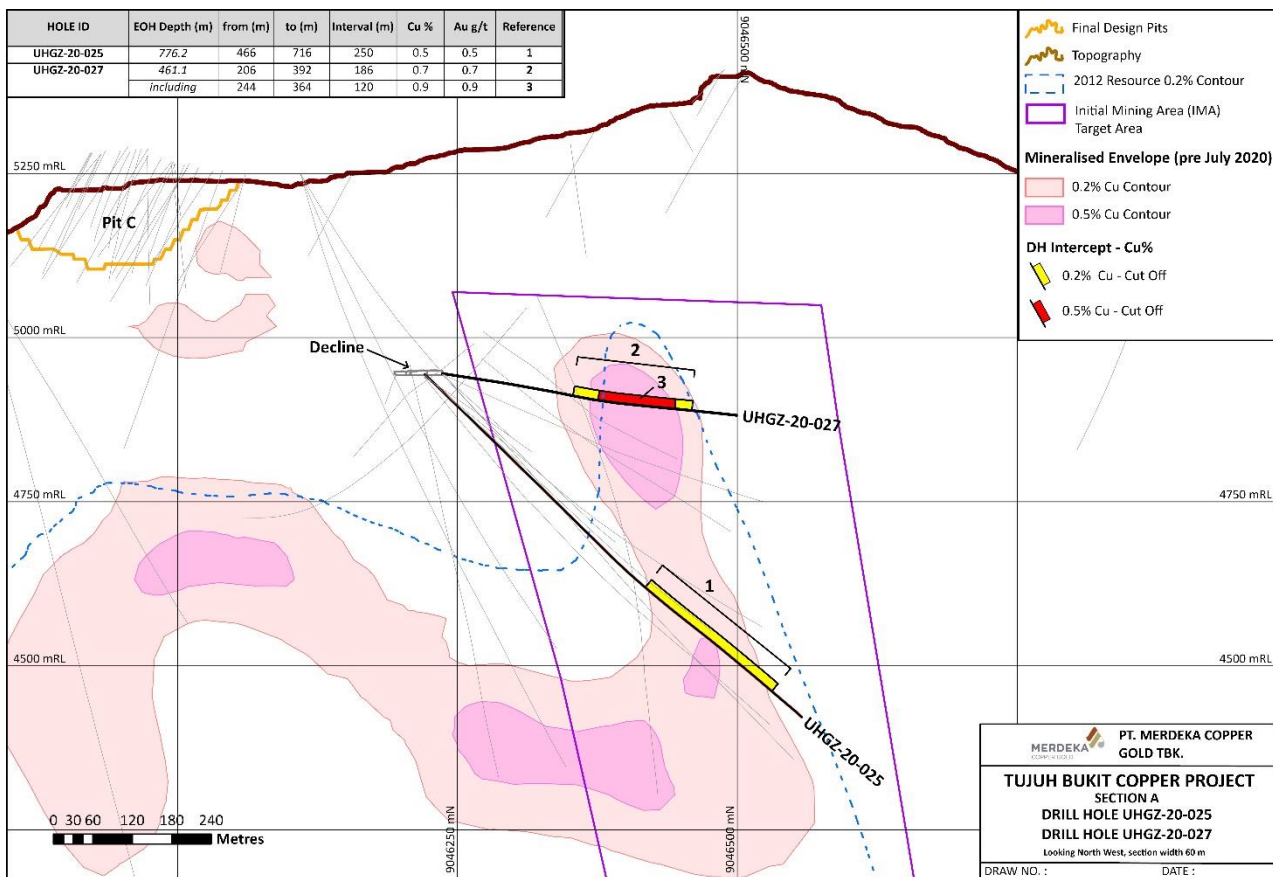

Figure 2: Drill section A, showing drill holes UHGZ-20-025 & UHGZ-20-027 along with mineralised envelopes and drilling intercept information.

Drilling Section B – Drill holes UHGZ-20-028 and UHGZ-20-030

Drilling on this section has achieved its designed purpose of confirming the continuity of the mineralisation towards the top of the target area, and the foot wall and hanging wall contacts of the mineralisation.

Drill hole UHGZ-20-28 successfully drilled into the barren hanging wall with total depth of 535.7m, with a best mineralised intercept of 124 m @ 0.8 % Cu and 0.7 g/t Au, including 98m @ 0.9 % Cu and 0.8 g/t Au.

Drill hole UHGZ-20-030 was drilled up dip of UHGZ-20-028 to test the upper portion of the target area, and returned an excellent mineralised intercept of 184m @ 0.9 % Cu and 1.0 g/t Au, including 146m @ 1.0 % Cu and 1.1 g/t Au.

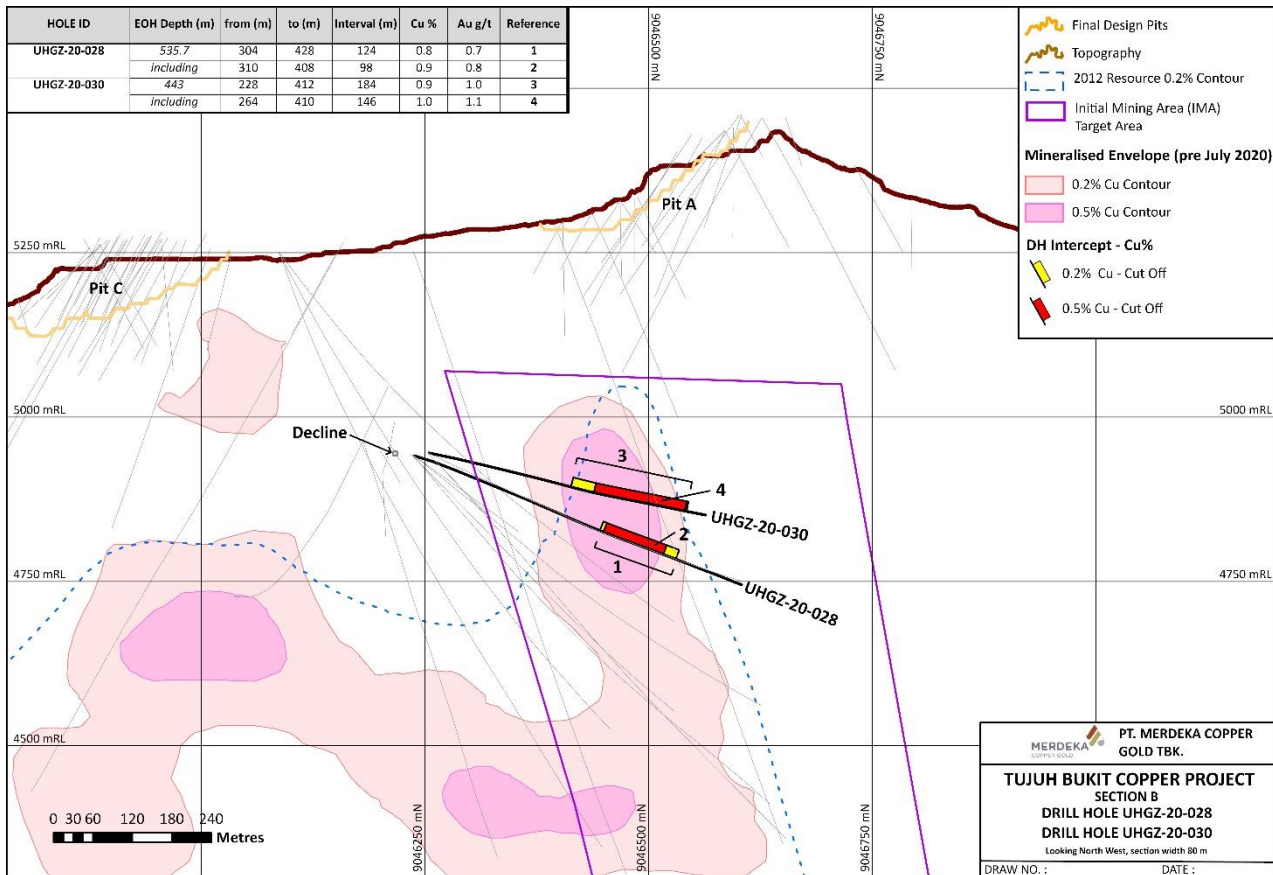

Figure 3: Drill section B, showing drill holes UHGZ-20-028 and UHGZ-20-030 along with mineralised envelopes and drilling intercept information.

Drilling Section C – Drillhole UHGZ-20-029

Drilling on this section is targeted at infilling a gap in the interpreted higher grade mineralisation and to test its upper extent.

Drill hole UHGZ-20-29 is the first of the planned holes on this section and was successfully completed to a planned depth of 650m. The results for the hole exceeded expectations, with a mineralised intercept of 242 m @ 0.7 % Cu and 1.0 g/t Au, including 192m @ 0.8 % Cu and 1.2 g/t Au.

Within the higher grade intercept above was a continuous zone of elevated gold results, returning 70m @ 0.9 % Cu and 2.0 g/t Au on the footwall side of the mineralisation. Investigation into the controls on this higher grade gold zone are ongoing.

Figure 4: Drill section C, showing drill hole UHGZ-20-029 along with mineralised envelopes and drilling intercept information.

Ongoing Operations

Underground drilling operations are continuing at TB Copper, with a further 7,500 metres of underground diamond drilling in the current campaign planned for completion by Q2 2021.

As previously announced, the company has mobilized larger drilling equipment to overcome the problems of drill holes not achieving the designed target depth. Four Sandvik DE150 diamond drilling rigs are currently operating from the northern end of the exploration decline, with a 5th rig planned to commence in Q2 2021. All holes drilled with these larger rigs have achieved target depths, and daily production rates are increasing as shown in the graph below.

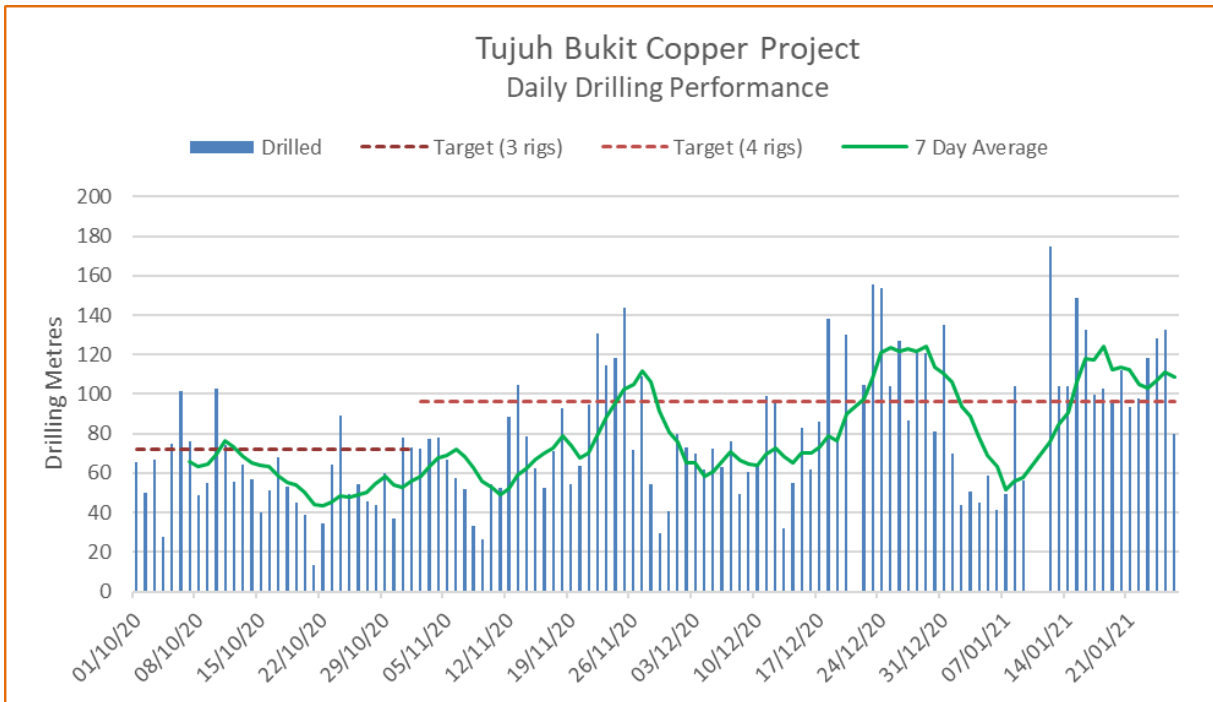

Figure 5: Daily drilling performance v’s target and rolling 7 day average for TB Copper Project underground drill rigs.

ABOUT TUJUH BUKIT COPPER PROJECT

Location

The Project is located approximately 205 kilometres southeast of Surabaya, the capital of the province of East Java, Indonesia and 60 kilometres southwest of the regional centre of Banyuwangi.

Access to the project area is via multiple daily flights to Banyuwangi. From Banyuwangi, it is about 60 kilometres to the Tujuh Bukit mine site via sealed public roads.

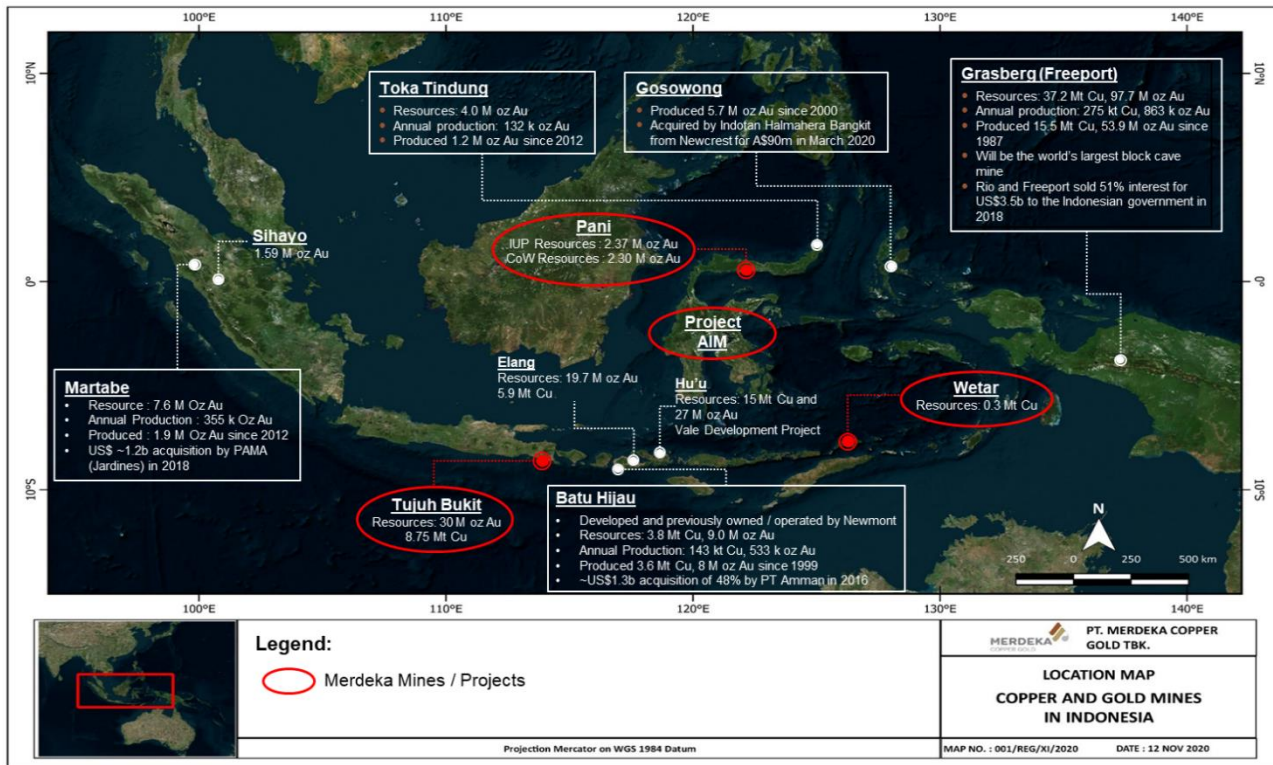

Figure 6: Tuijuh Bukit location, along with other major mines in Indonesia.

Geology & Resources

The Tuijuh Bukit high-sulphidation Au-Ag deposit and deeper Cu-Au-Mo mineralisation is part of the Tuijuh Bukit district in Southeast Java.

The mineralisation is related to a deep-seated sequence of tonalite porphyry intrusions and associated stock-works, which have intruded a basal sequence of volcanoclastic sandstones, siltstones and andesitic flows. A precursor diorite is crosscut by the outer margins of a diatreme breccia complex. The diatreme event and porphyry mineralisation is overprinted by high sulphidation alteration and associated mineralisation.

The most recent Mineral Resource estimate was released in December 2014, with the results tabulated below:

Table 1: Tuijuh Bukit Copper Project Resource at 0.2% Cu cut-off¹

Category	Ore (million tonnes)	Copper (%)	Gold (grams/tonne)	Copper (kilo tonnes)	Gold (million ounces)
Measured	-	-	-	-	-

COMPETENT PERSON’S STATEMENT – TUJUH BUKIT COPPER PROJECT

Exploration Results and Targets

The information in this report which relates to Exploration Activities and Exploration Results is based on, and fairly represents, information compiled by Mr Zach Casley, BSc (Hons). Mr Casley is full-time employee of PT Merdeka Copper Gold Tbk.

Mr Casley is listed as a CPI IAGI (#CPI-200), a Member of the Indonesian Geologists Association (ID: 7083B), a Member of a Masyarakat Geologi Ekonomi Indonesia (ID: B-1173), a Fellow of the Australian Institute of Mining and Metallurgy (ID: 112745), and a Member of the Australian Institute of Geoscientists (ID: 1451)

Mr Casley has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2017 Kode KCMI for Reporting of Exploration Results, Mineral Resources and Mineral Reserves, and the 2012 Edition of the “Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves”.

Mr Casley consents to the inclusion in the report of the matters based on this information in the form and context in which it appears.

JORC CODE, 2012 EDITION – TABLE 1 REPORT

Section 1 Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> Nature and quality of sampling (eg. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. 	<ul style="list-style-type: none"> Half drill core samples are collected at two (2) metre intervals, core sizes sampled are PQ3, HQ3, and NQ3. Core recovery is recorded for every run, average recovery for the intervals included in this report are 95-98%. Where possible all core is orientated and cut along the orientation mark retaining down hole arrows. With the core rotated in the down hole position (i.e. orientation line towards the front of the core tray), the top half of the core is consistently sampled. Industry standard QAQC protocols included the insertion of certified OREAS standards, duplicates, and blanks. Samples are submitted to the lab for analysis in batches of 40 samples comprising; 35 x 2 metres composite core samples, 2 x standards (6%), 2 x coarse (2

	<ul style="list-style-type: none"> • Aspects of the determination of mineralisation that are Material to the Public Report. • In cases where 'industry standard' work has been done this would be relatively simple (eg. 'reverse circulation drilling was used to obtain 1 meter samples from which 3 kilograms was pulverised to produce a 30 grams charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg. submarine nodules) may warrant disclosure of detailed information.
Drilling techniques	<ul style="list-style-type: none"> • millimetres) duplicates (6%), and 1 x coarse blank. External checks and blind resubmissions to an umpire laboratory are at a rate of 1 in 20 (5%), using an additional split at the pulp stage. The same pulps are used for external checks and blind resubmissions, which are submitted with anonymously packaged certified standards. • Analysis of QAQC results suggest sample assays are accurate. • Core samples are weighed, then dried at 60°C, weighed, then the entire sample is crushed to P95% -2 millimetres in a Boyd Crusher with rotary splitter. A 1.5 kilograms split of this material is then pulverised to P95% -200#. • Core samples are processed at Intertek's onsite sample preparation facility, approximately 200 grams pulverised material from each sample is transported direct from site to Intertek Jakarta for analyses. • All exploration drill samples are analysed for gold using 30 grams fire assay, ICP 4-acid digestion with AAS finish, total sulphur (LECCO), sulphide sulphur, mercury by cold vapor method, and sequential copper analysis testing for acid and cyanide soluble copper. • Standard multi-element analyses are used with ICP OES that includes silver and common pathfinder minerals in epithermal and porphyry systems. • No adjustments or calibrations were made to any assay data used in reporting.
Drill sample recovery	<ul style="list-style-type: none"> • Drill type (eg. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). • Measurements of core loss and recovery are made at the drill rig, and entered into Geobank Database. Core is marked up relative to core blocks making allowance for any sections of lost core. • In some instances, short lengths of core are lost, generally around 5-10 centimetres at the end of a run. This loss

	<ul style="list-style-type: none"> • Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	<p>occurs mostly in the clay dominant ore and waste domains. Drill runs are reduced to 1.5 metres or less in these areas to maximise core recovery. A null grade is assigned to core loss intervals.</p> <ul style="list-style-type: none"> • All core loss is clearly identified in the core trays by inserting a length of yellow plastic matching the area of core loss, and marked as “core loss”. • No grade is assigned to intervals of core loss in the database.
Logging	<ul style="list-style-type: none"> • Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. • Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. • The total length and percentage of the relevant intersections logged. 	<ul style="list-style-type: none"> • All drill core is geologically, geotechnically, and structurally logged. Logging fields include (but is not limited to) lithology, alteration, mineralisation, structure, RQD, RMR, and defect angles. • Standard nomenclature is used for logging and codes or abbreviations are input directly into computerised logging sheets. BSI uses Geobank Mobile by Micromine as the front-end data entry platform to the SQL backend. • The majority of geological and geotechnical logging is qualitative in nature except measured fields for structure (α and β), RQD and fracture frequency. • All core is measured with an Equotip at 7.5 centimetre intervals, which are averaged and reported at 1 meter intervals. • Point Load Testing is conducted every 25 metres on all holes. • All core is scanned on site using CoreScan. Mineralogy is logged qualitatively. • The length of core from holes being reported from the geotech and resource definition drilling is 5,669.1 metres, including surface and underground drilling. 100% of core was logged. • There is no selective sampling, all core is logged and assayed. • All mineralised intervals are sampled. • All drill core is photographed and scanned by CoreScan before cutting and sampling. • Logging is of a suitable standard to allow for detailed geological and resource modelling.
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> • If core, whether cut or sawn and whether quarter, half or all core taken. • For all sample types, the nature, quality and appropriateness of the 	<ul style="list-style-type: none"> • Core is cut with a saw and half core composites were collected at two (2) intervals. • Half core samples were methodically marked up, labelled, cut and prepared at the company’s core processing facility on site under geological supervision. Two (2)

	<p>sample preparation technique.</p> <ul style="list-style-type: none"> • Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. • Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. • Whether sample sizes are appropriate to the grain size of the material being sampled. 	<p>metre compositing is appropriate for the broad style of porphyry-type related mineralisation.</p> <ul style="list-style-type: none"> • The entire half core 2 metres sample is crushed to -6 millimetres in a terminator crusher, then crushed to -2 millimetres in a Smart Boyd crusher with rotary splitter. The first sub sampling is via the Boyd Rotary Splitter, which is set to provide a 1.5 kilograms sub sample for pulverisation to -75 microns in 2 x Labtechnics LM2 pulverisers. 200 grams of material is representatively scooped after the LM2 bowl is emptied onto a rolling sampling mat. This material is sent to ITS Jakarta for analysis. • Duplicate assaying is carried at a frequency of 6%, with 2 millimetres coarse reject duplicate spits. Heterogeneity analysis shows a high level of repeatability. • Mineralogical analyses including MLA (mineral liberation analyses) shows gold grains to be 10s of microns in size. Disseminated copper mineralisation shows a range from very fine to coarse grain size. Sample size (2 metres half core) and partial sample preparation protocols are considered appropriate for this style of mineralisation.
<p>Quality of assay data and laboratory tests</p>	<ul style="list-style-type: none"> • The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. • For geophysical tools, spectrometers, handheld XRF instruments, etc, the parametres used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. • Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. 	<ul style="list-style-type: none"> • The bulk nature of the sample size (2 metres) and partial preparation procedures (total crush to P95 -2 millimetres, 1.5 kilograms split pulverized to P95 -200#) is considered appropriate for this style of mineralisation. Four acid total dissolution is used for assaying. • SWIR data is collected on some of the core and assay pulps. The TerraSpec device used is serviced and calibrated yearly at an accredited facility in Australia and routine calibration is done when samples are being analyzed. Hyperspectral logging is carried out on site by CoreScan, calibrations are carried out before every core tray is analysed. • Industry standard QAQC protocols included the insertion of certified OREAS standards, duplicates, and blanks. Samples are submitted to the lab for analysis in batches of 40 samples comprising: 35 x 2 metres composite core samples; 2 x standards (6%); 2 x coarse reject duplicates (6%); and 1 x coarse blank. External checks and blind

		<ul style="list-style-type: none"> resubmissions to an umpire laboratory are at a rate of 1 in 20 (5%). Analyses of laboratory replicate assays and duplicate assays show a high degree of correlation. Analyses of Standards show all assay batches to be within acceptable tolerances.
Verification of sampling and assaying	<ul style="list-style-type: none"> The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data. 	<ul style="list-style-type: none"> Significant intersections have been verified by alternative senior company personnel. The drill holes being reported are exploration in nature and have not been twinned. Primary assay data is received from the laboratory in soft-copy digital format and hard-copy final certificates. Digital data is stored on a secure SQL server on site with a back-up copy off site. Hard-copy certificates are stored on site in a secure room. There is no adjustment to assay data (for example, no averaging Au analysis).
Location of data points	<ul style="list-style-type: none"> Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. 	<ul style="list-style-type: none"> Drill hole collars are surveyed by total station. The Grid System used is WGS84 UTM 50 South. The topographic surface is surveyed by LIDAR and supplemented by Total Station and DGPS surveys.
Data spacing and distribution	<ul style="list-style-type: none"> Data spacing for reporting of Exploration Results. Whether sample compositing has been applied. 	<ul style="list-style-type: none"> Drill hole spacing ranges from 300m to 80m in more densely drilling areas. Results reported have been composited, composite grades are weighted average grades with no top cuts applied.
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	<ul style="list-style-type: none"> Sampled drill holes were designed in 3D to intersect mineralisation at a range of orientations to assess and accommodate potential orientation of mineralisation and structures, while maintaining appropriate spacing between holes. The orientation of samples relative to structural controls is not considered to introduce a sampling bias.
Sample security	<ul style="list-style-type: none"> The measures taken to ensure sample security. 	<ul style="list-style-type: none"> All core samples are bagged separately into calico bags then dispatched

	<p>immediately to the on-site sample preparation facility operated by Intertek. The core shed has 24-hour security guards, and is fully covered by CCTV. The ITS preparation facility has separate swipe card access to maintain clear chain of custody. After sample preparation, 200 gm aliquots are securely packed and couriered via air freight to ITS Jakarta for analysis.</p>
<p>Audits or reviews</p>	<ul style="list-style-type: none"> • The results of any audits or reviews of sampling techniques and data. • Dr Francois-Bongarçon (Agoratek International) is engaged to conduct regular reviews and audits of sampling, QAQC, site and external laboratories, and plant samplers, as well as training and improvement initiatives. He has provided input into the design of the prep facility and sample size. His most recent site visit was in November 2019. • AMC were engaged to oversee the entire process from drill design, executing the drilling, data collection at the rig and core shed, sample preparation, analysis, and QAQC. AMC have made a number of recommendations to align with best practice and these recommendations have been incorporated, and indicate that the site processes is best practice. AMC have visited the site approximately every six months to confirm the procedures are being followed. The last AMC visit was March 2020.

Section 2 Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	<ul style="list-style-type: none"> The Company, via wholly owned subsidiary, PT BSI, owns the Mining Business License (IUP) for Operation and Production for the Tujuh Bukit Project and covers an area of 4,998 hectares. The IUP for Operation and Production is valid for an initial 20 (twenty) years and is extend-able by way of 2 (two) distinct 10 (ten) year options. A wholly owned subsidiary of PT BSI, PT Damai Suksesindo, holds an adjoining IUP Exploration covering an area of 6,558.46 hectares.
Exploration done by other parties	<ul style="list-style-type: none"> Acknowledgment and appraisal of exploration by other parties. 	<ul style="list-style-type: none"> The Tujuh Bukit project and surrounds has been explored since the early 1990s. The first “porphyry” intercept was in 2008 and since that time there has been a sharp increase in the rate of drilling and resource definition. Both oxide and porphyry projects were significantly advance during the period 2010 – 2012 by ASX listed Intrepid Mines Limited.
Geology	<ul style="list-style-type: none"> Deposit type, geological setting and style of mineralisation. 	<ul style="list-style-type: none"> Tujuh Bukit is classified as a high-level porphyry copper-gold-molybdenum deposit (sulphide) with an overlying high-level high-sulphidation epithermal gold-silver deposit (oxide). The deposit is located along the Sunda Banda Arc and is controlled by NNW trending arc transverse structures. The upper levels of the porphyry system represent an elliptical donut shaped area of high-grade Cu-Au-Mo epithermal mineralisation that sits within the carapace of the Tujuh Bukit porphyry deposit where mineralisation is hosted within structurally controlled porphyry apophyses and breccias, which as the system has evolved have been

Criteria	JORC Code explanation	Commentary
		<p>enhanced and overprinted by telescoped high-sulphidation epithermal copper-gold mineralisation.</p> <ul style="list-style-type: none"> The high-sulphidation mineralisation has been strongly oxidized near-surface.
<p>Drill hole Information</p>	<ul style="list-style-type: none"> A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes. 	<ul style="list-style-type: none"> Refer to above figures & tables.
<p>Data aggregation methods</p>	<ul style="list-style-type: none"> In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated. 	<ul style="list-style-type: none"> The reported results are the weighted average calculated over the composited interval with no top or bottom cut applied. To delineate the extents of the broader intercepts reported a nominal grade boundary of 0.2 % Cu and or 0.2 parts per million Au was used. Shorter high-grade aggregate intercepts are selected where a clear grade break is visible in the data; these breaks can coincide with interpreted domain boundaries where domains are identified by having different alteration styles. Metal equivalent values are not used.
<p>Relationship between mineralisation widths and</p>	<ul style="list-style-type: none"> These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with 	<ul style="list-style-type: none"> Refer to above figures. Holes reported are drilled at various angles to assess and accommodate mineralised geometry. Some holes

Criteria	JORC Code explanation	Commentary
intercept lengths	respect to the drill hole angle is known, its nature should be reported.	are drilled sub parallel to the long axis of mineralisation.
Diagrams	<ul style="list-style-type: none"> Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	<ul style="list-style-type: none"> Refer to above figures & tables.
Balanced reporting	<ul style="list-style-type: none"> Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. 	<ul style="list-style-type: none"> Refer to above figures & tables.
Other substantive exploration data	<ul style="list-style-type: none"> Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. 	<ul style="list-style-type: none"> All historical drill intercepts if shown were reported to the ASX in 2008 - 2012 by Intrepid Mines Ltd.
Further work	<ul style="list-style-type: none"> The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling). 	<ul style="list-style-type: none"> Future work to follow up on reported results will take place in 2020 with up to 50,000 metres of additional drilling from the exploration decline.

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.

About Merdeka Copper & Gold Tbk.

PT Merdeka Copper Gold Tbk (“Merdeka”), a holding company with operating subsidiaries engaging in mining business activities, encompassing: (i) exploration; (ii) production of gold, silver, copper (and other related minerals); and (iii) mining services. The subsidiaries are: (i) PT Bumi Suksesindo (“BSI”) as the holder of the operation production mining business license for the Tujuh Bukit mine; (ii) PT Damai Suksesindo (“DSI”) which holds the adjacent exploration permit; (iii) PT Batutua Tembaga Raya (“BTR”) as the holder of operation production mining business license specifically for processing and refining; (iv) PT Batutua Kharisma Permai (“BKP”) as the holder of the operation production mining business license for the Wetar Copper mine; (v) PT Merdeka Mining Servis (“MMS”) as the holder of mining services business license; (vi) PT Pani Bersama Tambang (“PBT”), as the holder of an operation production mining business license specifically for processing and refining; and (vii) PT Puncak Emas Tani Sejahtera (“PETS”), as the holder of an operation production mining business license for Pani Gold Project.

The company’s major assets, in order of management’s assessment of future value, are the: (i) Tujuh Bukit Copper Project; (ii) Pani Joint Venture; (iii) Wetar / Morowali Acid Iron Metal Project; (iv) Tujuh Bukit Gold Mine and; (v) Wetar Copper Mine.

The Tujuh Bukit Copper Project deposit is one of the world’s top ranked undeveloped copper and gold mineral resources, containing approximately 8.7 million tonnes of copper and 28 million ounces of gold.

As a world-class Indonesian mining company, Merdeka is owned by prominent Indonesian shareholders including: PT Saratoga Investama Sedaya Tbk., PT Provident Capital Indonesia and Mr. Garibaldi Thohir. Merdeka’s three major shareholders have exceptional track records in successfully identifying, building and operating multiple publicly listed companies in Indonesia.
